### PROJECT INTERNSHIP LETTER

#### TO WHOM IT MAY CONCERN

This is to certify that Ms. **Shama Perween**, a student of ARKA JAIN University, Jharkhand, Jamshedpur has successfully completed her Project Internship/Training (Virtual) with our organization as a **Full Stack Web Developer** during the period of November 2021 to February 2022.

The topic of the project was:

#### **"Hostel Management System"**

The Frontend and backend used for project development was HTML, CSS, JavaScript, BootStrap, PHP, MYSQL.

During this period of internship/training, she was found to be honest, creative & able to perform all her duties perfectly on the project.

We wish her all the best in all her future accomplishments.

For IT DEVELOPER

(Authorized Signatory)

**Address:** Rourkela, Odisha, India

**Website:** [itdeveloper.in](http://itdeveloper.in)      **E-mail:** [info@itdeveloper.in](mailto:info@itdeveloper.in)

## **ABSTRACT**

---

The purpose of Hostel Management System is to automate the existing manual system by the help of computerized equipments and full-fledged computer software, fulfilling their requirements, so that their valuable data/information can be stored for a longer period with easy accessing and manipulation of the same. The required software and hardware are easily available and easy to work with. A hostel management system was designed to provide a computerized process that is stress free, reliable and quick through the use of PHP computer programming language and MySQL database application to both the students and the staff in charge of the registration and hostel management processes. HTML would be at the front-end and provide the graphical user interface.

Hostel Management System, as described above, can lead to error free, secure, reliable and fast management system. It can assist the user to concentrate on their other activities rather than to concentrate on the record keeping. Thus it will help organization in better utilization of resources. The organization can maintain computerized records without redundant entries. That means that one need not be distracted by information that is not relevant, while being able to reach the information. The aim is to automate its existing manual system by the help of computerized equipments and full-fledged computer software, fulfilling their requirements, so that their valuable data/information can be stored for a longer period with easy accessing and manipulation of the same.

Thus, it will help organization in better utilization of resources. The organization can maintain computerized records without redundant entries. That means that one need not be distracted by information that is not relevant, while being able to reach the information. The aim is to automate its existing manual system by the help of computerized equipment and full-ledged computer software, fulfilling their requirements, so that their valuable data/information can be stored for a longer period with easy accessing and manipulation of the same. Basically, the project describes how to manage for good performance and better services for the clients

## **ACKNOWLEDGEMENT**

---

I would like to express my sincere gratitude to several individuals and organization for supporting me throughout the completion of my project.

First, I wish to express my sincere gratitude to my mentor **Sneha Kashyap** for her enthusiasm patience, insightful comments, helpful information, practical advices and unceasing ideas that have helped me tremendously at all times in my Project and writing of these thesis. Her immense knowledge, profound experience and professional expertise in Backend has enabled me to complete this project successfully. Without her support and guidance, this project would not have been possible.

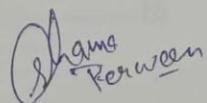

I am also thankful to our respected H.O.D **Dr. Arvind Kumar Pandey** and all faculty members for loving inspiration and timely guidance. I also wish to express my sincere thanks to the Department of Computer science & Information technology of **ARKA JAIN UNIVERSITY** for accepting this project.

## DECLARATION

I hereby declare that the Project entitled "**HOSTEL MANAGEMENT SYSTEM**" done at **ARKA JAIN UNIVERSITY** has not been in any case duplicated to submit to any other university for the award of any degree. To the best of my knowledge other than me, no one has submitted to any other university.

This project is done in partial fulfilment of the requirement for the award of degree of **BACHELOR OF COMPUTER APPLICATION** to be submitted as final semester project as part of our curriculum.

(Shama Perween)

## **1.INTRODUCTION**

---

**Hostel Management System** is for managing various activities of the hostel report. The report helps the user in case of Hostel Information, registration, room and Searching Hostel Account. Aim of this System report is to make the records of all the used tools and the time is taken. It helps users to get the reference for their project and many more.

An increase in an educational institution this system are also increasing for the accommodation. Therefore, report for them is also an online application will help students or users for managing various activities of hostel report. Deals with the problem of managing the hostel.Avoided the problem which occurs when carried out manually.

This system is designed in favour of the Hostel Management which helps them to save the records of the students about their rooms and other things. It helps them from the manual work from which it is very difficult to find the record of the students and the mess bills of the students and the information of about how many rooms are available. The hostel management system will also contain special features like how many students login .

The hostel management system is web based software to provide college students accommodation to the university hostel more efficiently. This project also keeps details of the hostellers and applied students. It is headed by Warden. She/he will be the administrator.

This document is intended to minimize human works and make hostel allocation an easier job for students and hostel authorities by providing online application for hostel, automatically select the students from the waiting list. Students will get approval notification in their mails, hostellers can view notice board , hostel fee by login into the online system.

## **OVERVIEW**

---

The Hostel Management System is developed in favour of the hostel management team which helps them to save the records of the students about their rooms and their things. It helps them from the manual work from which it is very difficult to find the record of the student and the information about these ones who had help the hostel years before. This solution is developed on the plight of the hostel management team through this they cannot require so efficient person to handle and manage the affairs of the students in the hostel, all you need to do is to login as administrator and you can see the information of all the students who have obtained and registered their hostel form, click verify to assertion their slightly and allocate them to the available hostel. We can improve the efficiency of the hostelmanagement, thus overcome the drawbacks of the existing management.

## **1.1 OBJECTIVES**

- To make it easier for data collection, storage and referencing reliable.
- To maintain the students as hostellers and waiting list students separately.
- To process allotment list.

## **1.2 PROBLEM STATEMENT**

There are a lot of drawbacks in keeping and maintaining a hostel. Especially with a manual system. Since most hostels are being run by only one hostel manager, the number of students in a room are sometimes not known by the officer. He has to go room by room to ensure that a room is occupied or not. Sometimes people may be owing in the hostel and they are saved on papers or huge notebooks, and sometimes receipts. If the books should go missing or stolen, one would never be able to know if a student is owing or not. Room allocation also becomes a problem as the officer might not know which rooms are available or not. And some hostels have a lot of rooms or have more storeys and it would be very tedious to go through all storeys in search of a free room for an applicant. Also the officer might not know the number of students in a room or know if a room is full or not. This project is aimed at developing a system for keeping records and showing information about or in a hostel. This system will help the hostel officer to be able to manage the affairs of the hostel.

## **1.3 FEATURES**

- Student Panel
- Admin Panel
- Student Registration
- Book Hostel
- View Personal Room Details
- Manage Hostel Students
- Manage Hostel Room
- Set Pricing Details

- Course Management
- Account Settings

#### **1.4 LIMITATIONS OF STUDY**

Time and financial constraints were the major factors that hindered the progress of this research. The study involved a lot of financial obligations such as the cost of stationary, printing, photocopying and transportation. Moreover, combining fieldwork and lectures to produce a comprehensive research report within the time limit was tiresome. Nevertheless, the quality of this study was not.

#### **1.5 PROPOSED SYSTEM**

This project is aimed at developing a system for keeping records and showing information about or in a hostel. This system will help the hostel officer to be able to manage the affairs of the hostel. This system will provide full information about a student in the hostel. It will show rooms available or not and number of people in a particular room. This will also provide information on students who have paid in full or are still owing. This system will also provide a report on the summary detail regarding fees and bills students are owing. Also included is a user module for employees or the hostel officer. There will also be an administrator module which will be accessed by the administrator and has the ability to delete, add and edit employee records. This system will be developed based on Software Development Life Cycle (SDLC) with PHP and MySQL server. PHP is good for the development and design of web based programs while MySQL is good for databases because of its security and its advanced features and properties.

## **Chapter 2**

### **2.SYSTEM ANALYSIS**

---

#### **2.1 REQUIREMENT ANALYSIS AND SPECIFICATION**

Functions and features delivered to the end users. The end users of the proposed system are:

##### **USER MODULE**

This helps the administrator and user to login to homepage only if password and username matches.

##### **CHANGE PASSWORD MODULE**

Allows the user to change the password.

##### **STUDENT MODULE**

This module is used to store student details i.e. information like profile details, contact information, educational details etc. Users can search according different criteria such as name, course, room number etc.

##### **ROOM ALLOTMENT MODULE**

This deals with allocation of room to students according to education details, section or course. Rooms will be allocated to students and an ID will be generated for it. It will display details of students staying in the room or rooms. When a student leaves the room after this semester, the last date will be also saved.

##### **ROOM FEES MODULE**

This displays fee records depending on the kind of room they choose, whether they avail mess facilities and calculate and display the final bill amount.

##### **REPORT GENERATION MODULE**

This is provided to view summary detail regarding hostel fees and bills. Students can checkhostel fees and bill details by entering the unique hostel ID.

## SETTINGS MODULE

In this module, only the administrator can access. Administrator has a unique account withmuch special access and permissions over normal users. Module allows add, edit, delete andemployee records, building block information, room details, course details etc.

## USER PANEL

1. User Registration - User can register through user registration form
2. User Login - User can login through login form
3. Forgot Password - user can retrieve password through forgot password link
4. User Dashboard
5. User Profile - User can manage own profile
6. Book Hostel – User can book hostel
7. Room Details - Booked Room Details
8. Change Password - User Can change own password
9. User access log - User can watch last login detail

## **2.1 Software Requirement Specification(SRS)**

A software requirements specification (SRS) is a detailed description of a software system to be developed with its functional and non-functional requirements. The SRS is developed based the agreement between customer and contractors. It may include the use case of how user is going to interact with software system. The software requirement specification document consistent of all necessary requirements required for project development. To develop the software system we should have clear understanding of software system. To achieve this we need to continuous communication with customers to gather all requirements.

**2.1.1 Data Gathering** Data Gathering is the process of gathering and measuring information on variables of interest, in an established systematic fashion that enables one to answer stated research questions, test hypotheses, and evaluate outcomes. The data collection component of research is common to all fields of study including physical and social sciences, humanities, business, etc. Data gathering techniques used in the (Software Development Lifecycle) SDLC.

## **2.5 FEASIBILITY STUDY**

### **A. TECHNICAL FEASIBILITY**

The technical feasibility in the proposed system deals with the technology used in the system. It deals with the hardware and software used in the system whether they are of latest technology or not and if it happens that after a system is prepared, a new technology arises and the user wants the system based on that technology. This system uses windows platform, apache server, sql for database, php as the language and html or xml as user interface. Thus HOSTEL MANAGEMENT SYSTEM is technically feasible.

### **B. ECONOMIC FEASIBILITY**

Economic analysis is the most frequently used method for evaluating the effectiveness of a new system. More commonly known as cost/benefit analysis. Php, html, xml and sql databases are easily available on internet.

## **C. OPERATIONAL FEASIBILITY**

The project has been developed in such a way that it becomes very easy even for a person with little computer knowledge to operate it. This software is very user friendly and does not require any technical person to operate. Thus the project is even operationally feasible.

### **2.1.3 Software Process Model**

To solve an actual problems in an industry, software developer or a team of developers must integrate with a development strategy that include the process, methods and tools layer and generic phases. This strategy is often referred to a process model or a software developing paradigm. Our project follows the waterfall model. The steps of waterfall model are:

- \* Requirement Definition
- \* System and software Design
- \* Implementation
- \* Integration and System Testing
- \* Operation and Maintenance

## **2.2 HARDWARE CONFIGURATION**

The section of hardware configuration is an important task related to the software development. Insufficient random access memory may affect adversely on the speed and efficiency of the entire system. The process should be powerful to handle the entire operations. The hard disk should have sufficient capacity to store the file and application.

Processor: Pentium III 630MHz

Processor speed: 1.4 GHz Onwards

System memory: 128 MB minimum (256 MB recommended)

Cache size: 512 KB

RAM: 218 MB

Printer: Inkjet/Laser Colour printer provides at least 1000 Dpi

Hard disk: 20 GB

Monitor: SVGA Colour 15"

Mouse: 104 keys US Key Serial, USB or PS/2

## **2.3 SOFTWARE CONFIGURATION**

A major element in building a system is the section of compatible software since the software in the market is experiencing in geometric progression. Selected software should be acceptable by the firm and one user as well as it should be feasible for the system. This document gives a detailed description of the software requirement specification. The study of requirement specification is focused specially on the functioning of the system. It allows the developer or analyst to understand the system, function to be carried out the performance level to be obtained and corresponding interfaces to be established.

Technology Implemented: Apache Server Language

Used: PHP 5.3 or newer versions

Database: MySQL

User Interface: HTML

Web Browser: Mozilla, Chrome or Internet Explorer 8(or newer)

Software: XAMPP or WAMP Server

Operating System: Windows XP , Windows 98, Linux

Software Development kit : Java JDK 1.7 or Above

Scripting Language Enabled: JSP(Java Server Pages)

## **2.4 JUSTIFICATION OF SELECTION OF TECHNOLOGY**

**2.4.1 XAMPP** is a free and open-source cross-platform web server solution stack package.XAMPP is an abbreviation where X stands for Cross-Platform, A stands for Apache, M stands for MYSQL, and the Ps stand for PHP and Perl, respectively. It is an open-source package of web solutions that includes Apache distribution for many servers and command-line executables.XAMPP helps a local host or server to test its website and clients via computers and laptops before releasing it to the main server. It is a platform that furnishes a suitable environment to test and verify the working of projects.

### **2.4.2 Language**

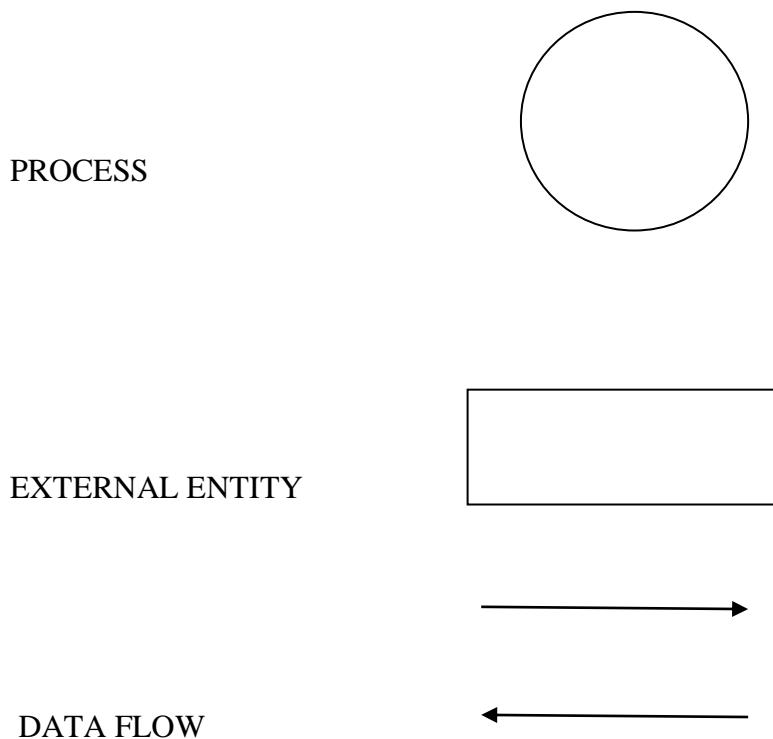

- **HTML** : Hypertext Markup Language is the standard markup language for documents designed to be displayed in a web browser. It can be assisted technologies such as Cascading Style Sheets and scripting languages such as JavaScript.
- **CSS** : Cascading Style Sheets (CSS) is a style sheet language used for describing the presentation of a document written in a markup language like HTML. CSS is a cornerstone technology of the World Wide Web, alongside HTML and JavaScript.
- **Bootstrap** : Bootstrap is a free and open-source CSS framework directed at responsive, mobile-first front-end web development. It contains CSS and JavaScript-based design templates for typography, forms, buttons, modals navigation, and other interface components
- **JavaScript** : JavaScript is a programming language that conforms to the ECMAScript specification. JavaScript is high-level, often just-in-time compiled, and multi-paradigm. It has curly-bracket syntax, dynamic typing, prototype-based object orientation, and first-class functions.
- **PHP** : PHP is a server side scripting language. that is used to develop Static websites or Dynamic websites or Web applications. PHP stands for Hypertext Pre-processor, that earlier stood for Personal Home Pages. PHP scripts can only be interpreted on a server that has PHP installed.

## **MY SQL?**

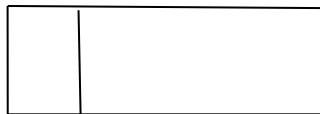

What is a database? Quite simply, it's an organized collection of data. A database management system (DBMS) such as Access, FileMaker Pro, Oracle or SQL Server provides you with the software tools you need to organize that data in a flexible manner. It includes facilities to add, modify or delete data from the database, ask questions (or queries) about the data stored in the database and produce reports summarizing selected contents. MySQL is a multithreaded,multi-user SQL database management system(DBMS). The basic program runs as a server providing multi-user access to a number of databases.Originally financed in a similar fashion to the JBoss model, MySQL was owned and sponsored by a single for-profit firm, the Swedish company MySQLAB now a subsidiary of Sun Microsystem , which holds the copyright to most of the codebase. The project's source code is available under terms of the GNU General Public Licence, as well as under a variety of proprietary agreements. MySQL is a database.The data in MySQL is stored in database objects called tables.A table is a collections of related data entries and it consists of columns and rows.Databases are useful when storing information categorically. A company may have a database with the following tables: "Employees", "Products", "Customers" and "Orders".

## 2.5 DATA FLOW DIAGRAM

Data flow diagram is the starting point of the design phase that functionally decomposes the requirements specification. A DFD consists of a series of bubbles joined by lines. The bubbles represent data transformation and the lines represent data flows in the system. A DFD describes what data flow rather than how they are processed, so it does not hardware, software and data structure. A data-flow diagram (DFD) is a graphical representation of the "flow" of data through an information system. DFDs can also be used for the visualization of data processing (structured design). A data flow diagram (DFD) is a significant modelling technique for analysing and constructing information processes. DFD literally means an illustration that explains the course or movement of information in a process. DFD illustrates this flow of information in a process based on the inputs and outputs. A DFD can be referred to as a Process Model. The data flow diagram is a graphical description of a system's data and how to Process transform the data is known as Data Flow Diagram (DFD). Unlike details flow chart, DFDs don't supply detail descriptions of modules that graphically describe a system's data and how the data interact with the system. Data flow diagram number of symbols and the following symbols are of by DeMarco.

DATABASE

There are seven rules for construct a data flow diagram.

I. Arrows should not cross each other.

II.Squares, circles and files must wear names.

III.Decomposed data flows must be balanced.

IV.No two data flows, squares or circles can be the same names.

V.Draw all data flows around the outside of the diagram.

VI.Choose meaningful names for data flows, processes & data stores.

VII.Control information such as record units, password and validation requirements are not penitent to a data flow diagram.

Additionally, a DFD can be utilized to visualize data processing or a structured design. This basic DFD can be then disintegrated to a lower-level diagram demonstrating smaller steps exhibiting details of the system that is being modelled. On a DFD, data items flow from an external data source or an internal data store to an internal data store or an external data sink, via an internal process. It is common practice to draw a context-level data flow diagram first, which shows the interaction between the system and external agents, which act as data sources and data sinks. On the contextdiagram (also known as the Level 0 DFD'), the system's interactions with the outside world are modelled purely in terms of data flows

across the system boundary. The context diagram shows the entire system as a single process, and gives no clues as to its internal organization.

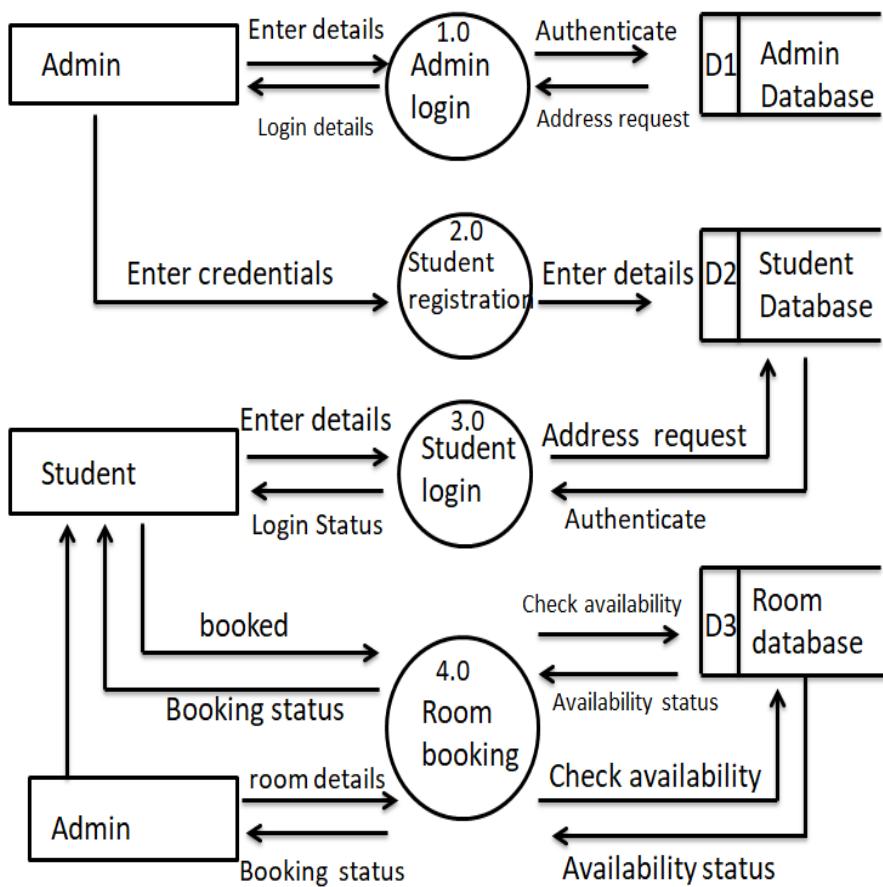

This context-level DFD is next "exploded", to produce a Level 1 DFD that shows some of the detail of the system being modelled. The Level 1 DFD shows how the system is divided into sub-systems (processes), each of which deals with one or more of the data flows to or from an external agent, and which together provide all of the functionality of the system as a whole. The level 1 DFD is further spreader and split into more descriptive and detailed description about the project as level 2 DFD. The level 2 DFD can be a number of data flows which will finally show the entire description of the software project.

## DFD LEVEL 2

# **Chapter 3**

## **3. SYSTEM DESIGN**

---

### **3.1 DATABASE DESIGN**

Database design is the process of producing a detailed data model of database. This data model contains all the need logical and physical design choices and physical storage parameters needed to generate a design in a data definition language, which can then be used to create a database. A fully attributed data model contains detailed attributes for each entity. The term database design can be used to describe many different parts of the design of an overall database system. Principally, and most correctly, it can be thought of as the logical design of the base data structure used to store the data. In the relational model these are the tables and views. In an object database the entities and relationships map directly to object classes and named relationships. However, the term database design could also be used to apply to the overall process of designing, not just the base data structure, but also the forms and queries used as part of the overall database application within the database management system.

### **3.2 ENTITY-RELATIONSHIP**

E-R Model is a popular high level conceptual data model. This model and its variations are frequently used for the conceptual design of database application and many database design tools employ its concept. A database that confirms to an E-R diagram can be represented by a collection of tables in the relational system. The mapping of E-R diagram to the entities are:

- Attributes
- Relations

Many-to-many

Many-to-one

One-to-many

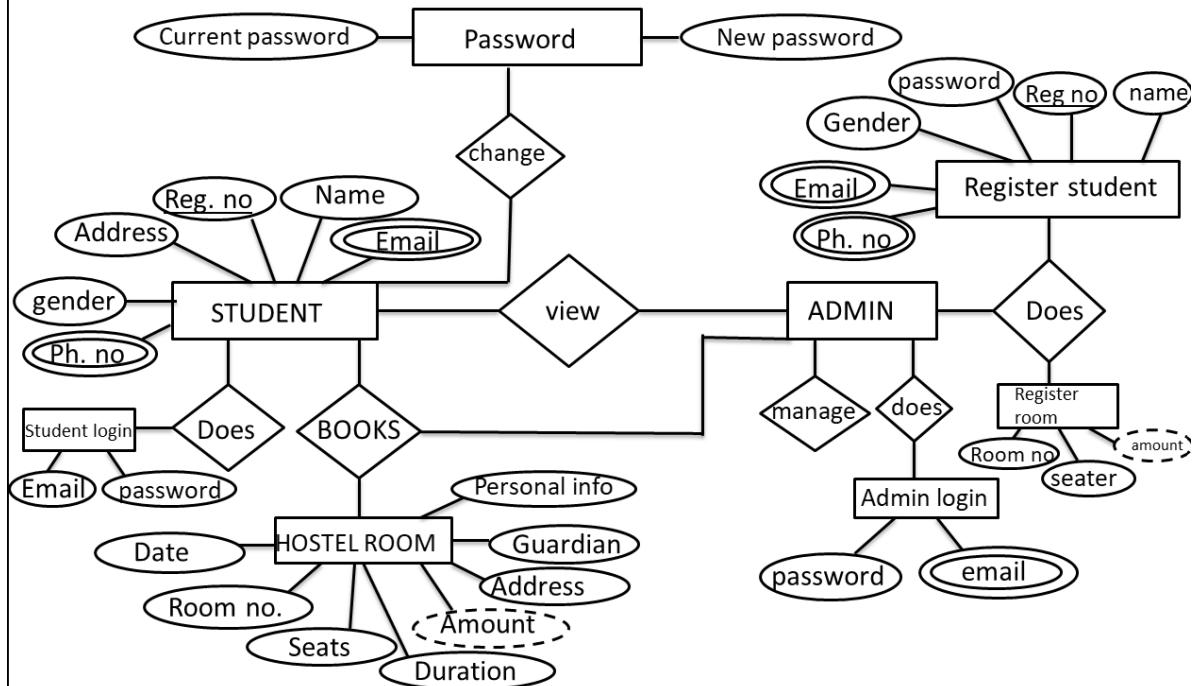

One-to-one

- Weak entities
- Sub-type and super-type

The entities and their relationships between them are shown using the following conventions.

- An entity is shown in rectangle.
- A diamond represents the relationship among number of entities.
- The attributes shown as ovals are connected to the entities or relationship by lines.
- Diamond, oval and relationships are labelled.
- Model is an abstraction process that hides super details while highlighting details relation to application at end.
- A data model is a mechanism that provides this abstraction for database application.
- Data modelling is used for representing entities and their relationship in the database.
- Entities are the basic units used in modelling database entities can have concrete existence or constitute ideas or concepts.
- Entity type or entity set is a group of similar objects concern to an organization for which it maintains data,
- A key is a single attribute or combination of 2 or more attributes of an entity set is used to identify one or more instances of the set.
- In relational model we represent the entity by a relation and use tuples to represent an instance of the entity.
- Relationship is used in data modelling to represent in association between an entity set.

## DIAGRAM

E R DIAGRAM

### **3.3 DATA NORMALIZATION**

---

Data normalization is generally considered the development of clean data. Diving deeper, however, the meaning or goal of data normalization is twofold: Data normalization is the organization of data to appear similar across all records and fields. It increases the cohesion of entry types leading to cleansing, lead generation, segmentation, and higher quality data.

#### **1. First Normal Form (1NF)**

The most basic form of data normalization is 1NF which ensures there are no repeating entries in a group. To be considered 1NF, each entry must have only one single value for each cell and each record must be unique.

#### **2. Second Normal Form (2NF)**

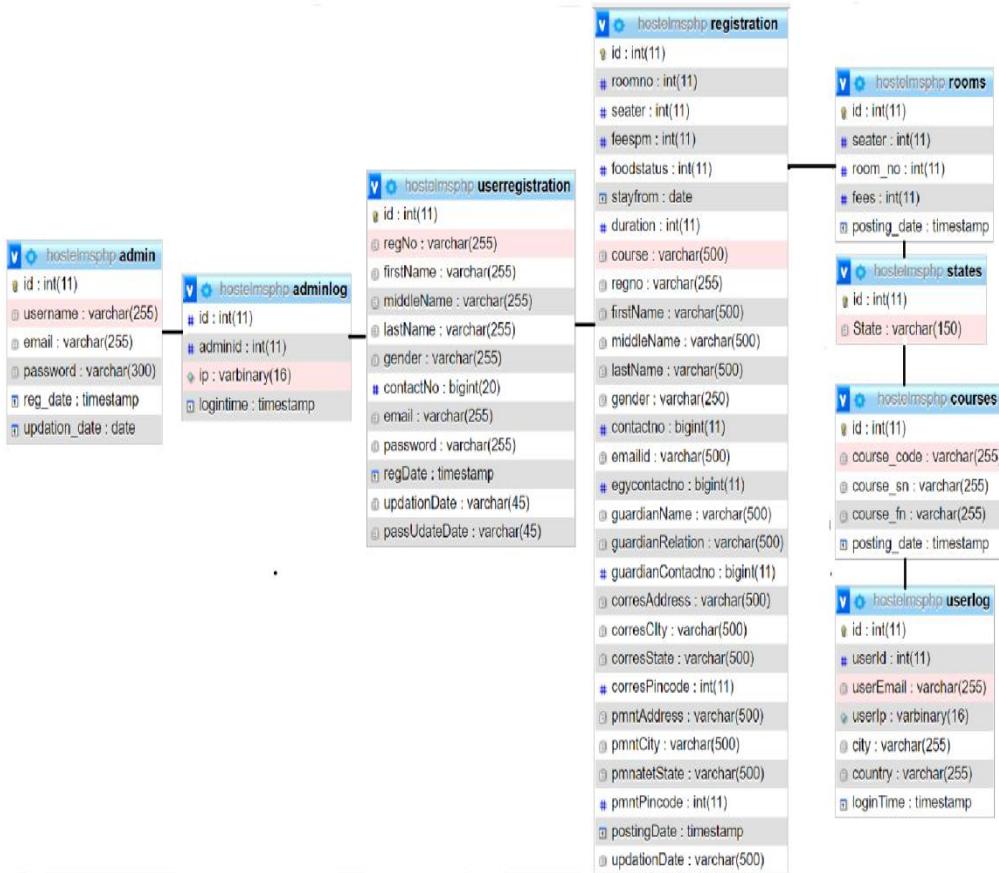

Again working to ensure no repeating entries, to be in the 2NF rule, the data must first apply to all the 1NF requirements. Following that, data must have only one primary key. To separate data to only have one primary key, all subsets of data that can be placed in multiple rows should be placed in separate tables. Then, relationships can be created through new foreign key labels.

#### **3. Third Normal Form (3NF)**

For data to be in this rule, it must first comply with all the 2NF requirements. Following that, data in a table must only be dependent on the primary key. If the primary key is changed, all data that is impacted must be put into a new table.

For example, you are recording the name, address, and gender of a person but go back and change the name of a person. When you do this, the gender may then change as well. To avoid this, in 3NF gender is given a foreign key and a new table to store gender.

## DATABASE NORMALIZATION

## 3.4 DATA-DICTIONARY

A data dictionary, or metadata repository, as defined in the IBM Dictionary of computing, is a “centralized repository of information about data such as meaning relationship to other data, origin, usage, and format”.

The screenshot shows the MySQL Workbench interface with the following details:

Server: 127.0.0.1 » Database: hostelsmsphp » Table: admin

Table structure view:

#	Name	Type	Collation	Attributes	Null	Default	Comments	Extra	Action
1	id	int(11)	latin1_swedish_ci		No	None		AUTO_INCREMENT	Change  Drop  More
2	username	varchar(255)	latin1_swedish_ci		No	None			Change  Drop  More
3	email	varchar(255)	latin1_swedish_ci		No	None			Change  Drop  More
4	password	varchar(300)	latin1_swedish_ci		No	None			Change  Drop  More
5	reg_date	timestamp			No	current_timestamp()			Change  Drop  More
6	updation_date	date			No	None			Change  Drop  More

Below the table structure, there are buttons for: Check all, With selected:, Browse, Change, Drop, Primary, Unique, Index, Spatial, Fulltext.

Bottom navigation: Print, Propose table structure, Move columns, Normalize.

Add button: 1 column(s) after updation\_date Go

The screenshot shows the MySQL Workbench interface with the following details:

Server: 127.0.0.1 » Database: hostelsmsphp » Table: adminlog

Table structure view:

#	Name	Type	Collation	Attributes	Null	Default	Comments	Extra	Action

## **Chapter 4**

### **PROGRAM CODE AND TESTING**

#### **4.1 Existing System**

For the past few years the number of educational institutions are increasing rapidly. Thereby the number of hostels are also increasing for the accommodation of the students studying in this institution. And hence there is a lot of strain on the person who are running the hostel and software's are not usually used in this context. This particular project deals with the problems on managing a hostel and avoids the problems which occur when carried manually Identification of the drawbacks of the existing system leads to the designing of computerized system that will be compatible to the existing system with the system which is more user friendly and more GUI oriented. We can improve the efficiency of the system, thus overcome the following drawbacks of the existing system.

- more human error.**
- more strength and strain of manual labour needed**
- Repetition of the same procedures.**
- low security**
- Data redundancy**
- difficult to handle**
- difficult to update data**
- record keeping is difficult**
- Backup data can be easily generated**

# **IMPLEMENTATION**

Implementation is the stage in the project where the theoretical design is turned into a working system and is giving confidence on the new system for the users that it will work efficiently and effectively. It involves careful planning, investigation of the current system and its constraints on implementation, design of methods to achieve the change over, an evaluation of change over methods. Apart from planning major task of preparing the implementation are education and training of users. The implementation process begins with preparing a plan for the implementation of the system. According to this plan, the activities are to be carried out, discussions made regarding the equipment and resources and the additional equipment has to be acquired to implement the new system. In network backup system no additional resources are needed. Implementation is the final and the most important phase. The most critical stage in achieving a successful new system is giving the users confidence that the new system will work and be effective. The system can be implemented only after thorough testing is done and if it is found to be working according to the specification. This method also offers the greatest security since the old system can take over if the errors are found or inability to handle certain type of transactions while using the new system.

## **User Training**

After the system is implemented successfully, training of the user is one of the most important subtasks of the developer. For this purpose user manuals are prepared and handled over to the user to operate the developed system. Thus the users are trained to operate the developed system. Both the hardware and software securities are made to run the developed systems successfully in future. In order to put new application system into use, the following activities were taken care of:- Preparation of user and system documentation. Conducting user training with demo and hands on. Test run for some period to ensure smooth switching over the system. The users are trained to use the newly developed functions. User manuals describing the procedures for using the functions listed on menu are circulated to all the users. It is confirmed that the system is implemented up to users need and expectations.

## **Security and Maintenance**

Maintenance involves the software industry captive, typing up system resources .It means restoring something to its original condition. Maintenance follows conversion to the extend that changes are necessary to maintain satisfactory operations relative to changes in the user's environment. Maintenance often includes minor enhancements or corrections to problems that surface in the system's operation. Maintenance is also done based on fixing the problems reported, changing the interface with other software or hardware enhancing the software. Any system developed should be secured and protected against possible hazards. Security measures are provided to prevent unauthorized access of the database at various levels. An uninterrupted power supply should be so that the power failure or voltage fluctuations will not erase the data in the files. Password protection and simple procedures to prevent the unauthorized access are provided to the users .The system allows the user to enter the system only through proper user name and password.

## **4.2 Testing Approach**

### **SYSTEM TESTING**

System testing is the stage of implementation, which is aimed at ensuring that the system works accurately and efficiently before live operation commences. Testing is the process of executing the program with the intent of finding errors and missing operations and also a complete verification to determine whether the objectives are met and the user requirements are satisfied. The ultimate aim is quality assurance. Tests are carried out and the results are compared with the expected document. In the case of erroneous results, debugging is done. Using detailed testing strategies a test plan is carried out on each module. The various tests performed in “Network Backup System” are unit testing, integration testing and user acceptance testing.

#### **4.2.1 Types of Testing**

##### **Unit Testing**

The software units in a system are modules and routines that are assembled and integrated to perform a specific function. Unit testing focuses first on modules, independently of one another, to locate errors. This enables, to detect errors in coding and logic that are contained within each module. This testing includes entering data and ascertaining if the value matches to the type and size supported by java. The various controls are tested to ensure that each performs its action as required.

##### **Integration Testing**

Data can be lost across any interface, one module can have an adverse effect on another, sub functions when combined, may not produce the desired major functions. Integration testing is a systematic testing to discover errors associated within the interface. The objective is to take unit tested modules and build a program structure. All the modules are combined and tested as a whole. Here the Server module and Client module options are integrated and

tested. This testing provides the assurance that the application is well integrated functional unit with smooth transition of data.

## **User Acceptance Testing**

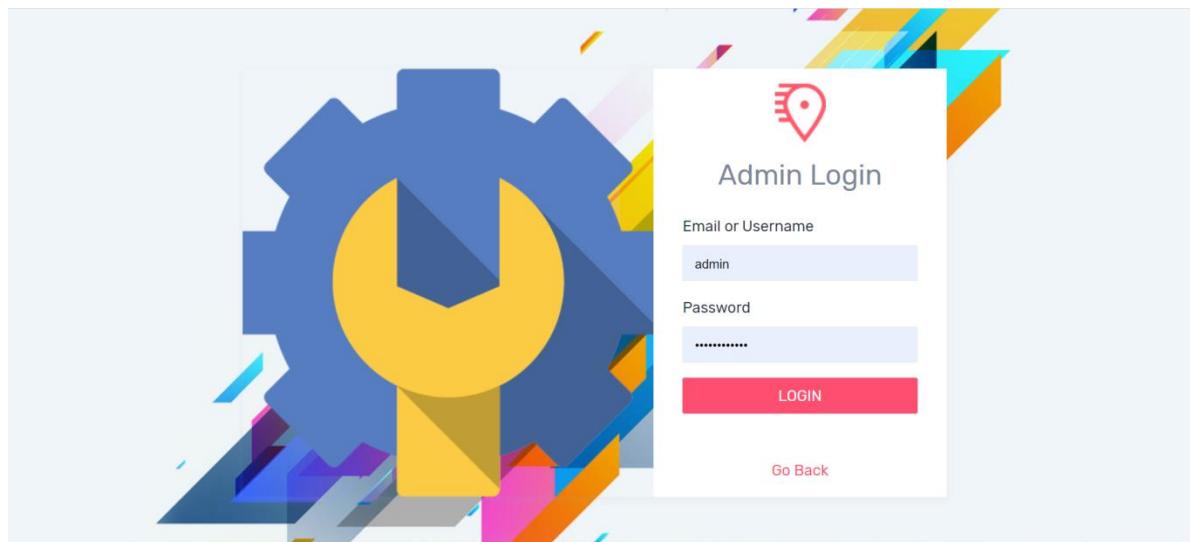

User acceptance of a system is the key factor for the success of any system. The system under consideration is tested for user acceptance by constantly keeping in touch with the system users at time of developing and making changes whenever required.

## **STUDENT LOGIN PAGE**

## STUDENT DASHBOARD

The screenshot shows the dashboard of a Hostel Management System. At the top left is the logo 'HOSTEL MANAGEMENT' with a purple circular icon containing a white film strip. At the top right is a user profile icon with the text 'Hello, SHIV' and a dropdown arrow. The main header says 'Good Afternoon, SHIV!'. On the left, a blue sidebar menu has 'Dashboard' selected. Below it, under 'FEATURES', are links for 'Book Hostel', 'My Room Details', and 'Log Activities'. The central content area displays four key statistics in boxes: '6 Registered Students' (with a person icon), '10 Total Rooms' (with a grid icon), '9 Booked Rooms' (with a clipboard icon), and '8 Featured Courses' (with a globe icon). The bottom footer reads '© 2022 - Hostel Management System - Developed by Anjali & Shama'.

## CHANGE PASSWORD IN STUDENT PANEL

The screenshot shows the 'Account Settings - Change Password' page. At the top right, there is a user profile icon with the text 'Hello, SHIV' and a dropdown arrow. On the left, a sidebar menu includes 'HOSTEL MANAGEMENT' with a logo, 'Dashboard' (selected), 'FEATURES' (with 'Book Hostel', 'My Room Details', and 'Log Activities'), and other links like 'About Us', 'Contact Us', and 'Logout'. The main content area has a title 'Account Settings - Change Password' and a note 'Last Updated On:'. It contains three input fields: 'Current Password', 'New Password', and 'Confirm Password'. Below the fields are 'Submit' and 'Reset' buttons. At the bottom, a copyright notice reads '© 2022 - Hostel Management System - Developed by Anjali & Shama'.

## **LIMITATIONS OF THE SYSTEM**

---

Although we have put our best efforts to make the software flexible, easy to operate but limitations cannot be ruled out even by me. Through the software present a broad range of options to its user some intricate options could not be covered into it; partly because of logistics and partly due to lack of sophistication. Paucity of time was also major constraint; thus, it was not possible to make the software full-proof and dynamic

Some of the limitations of the proposed system are:

- a. **The system cannot handle online payment of student's accommodation fee and maintenance fee.**
- b. The system cannot handle other hostel issues such as mess activities because the existing system does not have one.
- c. The admin has to enter student details manually. There are certain fields that need to be filled up for student booking. Such as naming details, registration code, guardian's information, and contact details.
- d. The admin has to register the student and provide the login credentials to the student either manually/ email, then only the student can login and access the system.

## **FUTURE SCOPE**

---

As the numbers of students grow, there will always be a need for an accommodation and in this scenario the most reliable and safest option would be booking a hostel which absolutely needs to be managed by the administration, i.e. warden. There are lot many things which go inside a management system so this system will always be handy. It is easy to extend the system that we have proposed. A person could see any of the issued, unissued or all the rooms according to his/her will. In future we can implement some features for “HOSTEL MANAGEMENT SYSTEM” project.

## **Chapter 6**

---

### **CONCLUSION**

---

To conclude the description about the project : The project, developed using PHP and MySQL is based on the requirement specification of the user and the analysis of the existing system, with flexibility for future enhancement. The expanded functionality of today's software requires an appropriate approach towards software development. This hostel management software is designed for people who want to manage various activities in the hostel. Hostel Management System is a Customizable and user-friendly software for Hostel. It has been designed to automate, manage and look after the overall processing of even very large hostel. It is capable of managing Enquiry details, Student Details, Payment Details etc. Hostel Management System is a Customized and user-friendly software for Hostel which provide hostel information, hostel room information, hostel accounts information. Hostel Management Software System is offering a maximum of stability, cost-effectiveness and usability. It provides the most flexible and adaptable standards management system software solutions for hostel.
