ABSTRACT

The Library management System is an application for assisting a librarian in managing a book library in a university. The system would provide basic set of feature to add/update books, and manage check in specifications for the system based on the client's statement of need.

Library management system is a typical management information system (MIS), its development include the establishment and maintenance of back-end database and front-end application development aspects. For the former require the establishment of data consistency and integrity of the strong data security and good libraries. As for the latter requires the application full functional, easy to use and so on.

ACKNOWLEDEMENT

Before we describe in brief about our project, we would like to add a few heartfelt words for the people who were very much helpful for us in developing this project .We heartily thankful to our Mam “ **Ms. Alka kumari** “ for giving us this opportunity to develop the project. We give him our sincere salute for inspiring and motivating us.

We would like to thanks whole teaching staff of Arka Jain university , who have contributed greatly to the success of this project.

I would like to specially thank “ **Dr. Arvind Kumar Pandey** “ our Head of the Department who gave me the golden opportunity to do this wonderful project on the topic “Library Management System”, which helped me in research and I came to know about so many things.

TABLE OF CONTENTS

Chapter 1

1. Introduction	—
1.1 Introduction	1
1.2 Objective	1
1.3 module	1

Chapter 2

2. Survey of Technologies	—
2.1 Software description	2
2.2 Languages	2
2.2.1 HTML	2
2.2.2 CSS	2
2.2.3 PHP	3
2.2.4 MySQL	3

Chapter 3

3. Requirements and analysis	—
3.1 Requirement Specification	4
3.2 Hardware and Software Requirements	4
3.3 Data flow diagram	4
3.3.1 Level 0	5
3.3.2 Level 1	5
3.3.3 Level 2	6
3.4 Data Dictionary	7
3.5 ER-Diagram	11
3.6 Normalization	12

Chapter 4

4. Program code ——————	
4.1 Code Details and Code Efficiency	17

Chapter 5

5. Result and Discussion ——————	
5.1. User Documentation	42

Chapter 6

6. Testing ——————	
6.1. Unit Testing	46
6.2. Integration Testing	46
6.3 System Testing	46
6.4. Acceptance Testing	46

Chapter 7

7. Conclusion ——————	
7.1 conclusion	47

Ch 1. INTRODUCTION

1.1 INTRODUCTION

A library management system is software that is designed to manage all the functions of a library. It helps librarian to maintain the database of new books and the books that are borrowed by members along with their due dates.

This system completely automates all your library's activities. The best way to maintain, organize, and handle countless books systematically is to implement a library management system software.

A library management system is used to maintain library records. It tracks the records of the number of books in the library, how many books are issued, or how many books have been returned or renewed or late fine charges, etc.

You can find books in an instant, issue/reissue books quickly, and manage all the data efficiently and orderly using this system. The purpose of a library management system is to provide instant and accurate data regarding any type of book, thereby saving a lot of time and effort.

1.2 OBJECTIVE

The main objective of the Library Management System is to manage the details of Address, Member, Issues, Books, Student. It manages all the information about Address, Librarian, Student, Address. The project is totally built at administrative end and thus only the administrator is guaranteed the access.

1.3 MODULE

- ADD NEW BOOKS
- VIEW BOOKS
- ISSUE BOOKS
- RENEW BOOKS
- RETURN BOOKS

Ch 2. SURVEY OF TECHNOLOGY

2.1 SOFTWARE DESCRIPTION

Visual studio Code

Visual Studio Code combines the simplicity of a source code editor with powerful developer tooling, like IntelliSense code completion and debugging.

First and foremost, it is an editor that gets out of your way. The delightfully frictionless edit-build-debug cycle means less time fiddling with your environment, and more time executing on your ideas.

2.2 LANGUAGES

2.2.1 HTML

Hypertext: text (often with embeds such as images, too) that is organized in order to connect related items

Markup: a style guide for typesetting anything to be printed in hardcopy or soft copy format

Language: a language that a computer system understands and uses to interpret commands.

HTML determines the structure of web pages. This structure alone is not enough to make a web page look good and interactive. So you'll use assisted technologies such as CSS and JavaScript to make your HTML beautiful and add interactivity, respectively.

2.2.2 CSS

CSS handles the look and feel part of a web page. Using CSS, you can control the color of the text, the style of fonts, the spacing between paragraphs, how columns are sized and laid out, what background images or colors are used, layout designs, variations in display for different devices and screen sizes as well as a variety of other effects.

2.2.3 PHP

PHP is a server side scripting language. that is used to develop Static websites or Dynamic websites or Web applications. PHP stands for Hypertext Pre-processor, that earlier stood for Personal Home Pages.

PHP scripts can only be interpreted on a server that has PHP installed.
The client computers accessing the PHP scripts require a web browser only.

2.2.4 MySQL

Many of the world's largest and fastest-growing organisations including Facebook, Google, Adobe, Alcatel Lucent and Zappos rely on MySQL to save time and money powering their high-volume Web sites, business-critical systems and packaged software. Since then, the performance & scalability, reliability, and ease of use of the world's most popular open source database, characteristics that made MySQL the #1 choice for web applications, have relentlessly been improved.

Ch 3. REQUIREMENT AND ANALYSIS

3.1 REQUIREMENTS SPECIFICATION

User Requirements

The system requirement in library management focuses on the possibility of search for books by title, author or subject by the member.

System Requirements

There should be a database backup of the library management system. Operating system should be WindowsXP or a higher version of windows.

3.2 HARDWARE AND SOFTWARE REQUIREMENTS

Software Requirements

- Operating System Windows 10
- Front End HTML , CSS , javascript
- Back End PHP, MySQL

Hardware Requirements

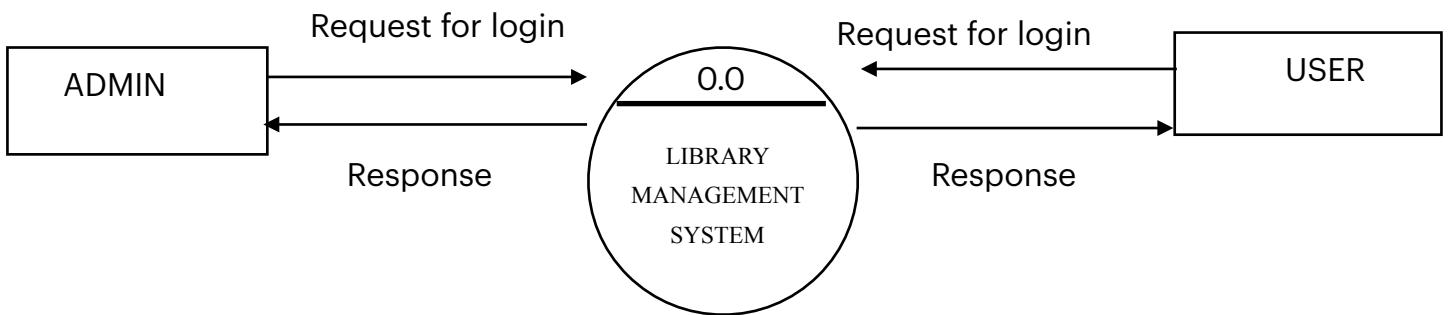

- Desktop PC or a Laptop
- Printer
- Operating System – Windows 10
- Intel® CoreTM i3-6006U CPU @ 2.00GHz • 4.00 GB RAM
- 64-bit operating system, x64 based processor • 1024 x 768 monitor resolution
- Keyboard and Mouse

3.3 DATA FLOW DIAGRAM

DFD is an important tool used by system analysis. A data flow diagram model, a system using external entities from which data flows through a process which transforms the data and creates output data transforms which go to other processes external entities such as files. The main merit of DFD is that it can provide an overview of what data a system would process.

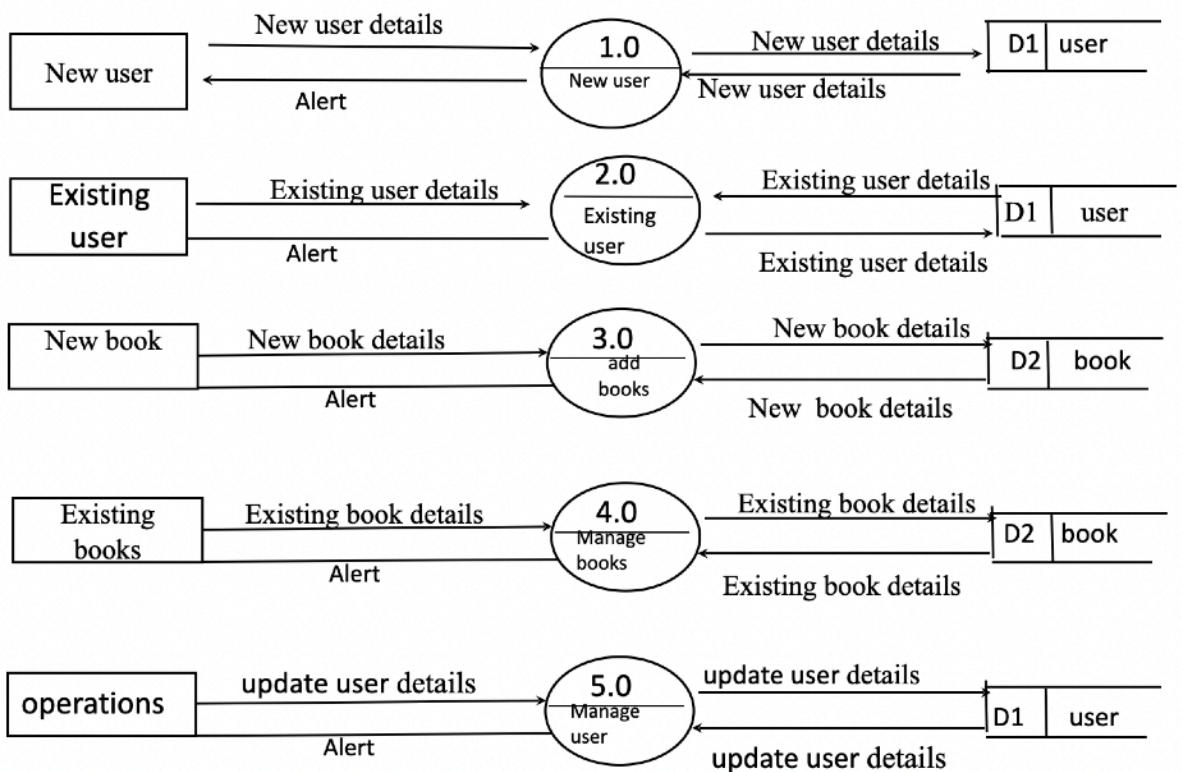

- A data-flow diagram is a way of representing a flow of data through a process or a system.
- The DFD also provides information about the outputs and inputs of each entity and the process itself.

CONTEXT LEVEL DFD :

Ch 5. RESULT AND DISCUSSION

5.1 USER DOCUMENTATION

LOGIN PAGE

ADMIN HOME PAGE

A screenshot of the Library Management System admin home page. The top navigation bar includes 'LMS' on the left and a user profile icon on the right. The main content area has a sidebar on the left with a dark background and white text, listing various administrative functions: Home, Messages, Manage Students, All Books, Add Books (which is selected, indicated by a checked checkbox), Issue/Return Requests, Book Recommendations, and Currently Issued Books. Below this is a 'Logout' button. The main panel on the right features a large, dark circular placeholder for a profile picture. Below it, the word 'admin' is displayed in a bold, italicized font. Underneath, the email ID 'Email ID: admin@gmail.com' and mobile number 'Mobile number: 123456789' are shown. At the bottom right of this panel is a blue 'Edit Details' button.

Book Name	Description	Recommended By
Book1	Descp1	B160158CS
Book2	Descp2	B160158CS
Operating System	An operating system (OS) is system software that manages computer hardware and software resources and provides common services for computer programs.	B160001CS
Networks	A computer network, or data network, is a digital telecommunications network which allows nodes to share resources. In computer networks, computing devices exchange data with each other using connections (data links) between nodes.	B160999CS
String Theory	In physics, string theory is a theoretical framework in which the point-like particles of particle physics are replaced by one-dimensional objects called strings. It describes how these strings propagate through space and interact with each other.	B160777CS
The Theory of Everything	The Theory of Everything	B160777CS

Ch 6. TESTING

6.1 Unit Testing

Unit testing is a testing technique in which modules are tested individually. Small individual units of source code are tested to determine whether it is fit to use or not. Different modules of games are put to test while the modules are being developed. Here modules refer to individual levels, players, scenes

6.2 Integration Testing

Integration testing is the technique in which individual components or modules are grouped together and tested. It occurs after testing. The inputs for the integrated testing are the modules that have already been unit tested.

6.3 System Testing

System testing is conducted on the entire system as a whole to check whether the system meets its requirements or not. software was installed on different systems and any errors or bugs that occurred were fixed.

6.4 Acceptance Testing

User Acceptance is defined as a type of testing performed by the Client to certify the system with respect to the requirements that was agreed upon. This testing happens in the final phase of testing before moving the software application to the Market or Production environment.

Ch 7. CONCLUSION

7.1 Conclusion

After we have completed the project we are sure the problems in the existing system would overcome. The “**LIBRARY MANAGEMENT SYSTEM**” process made computerized to reduce human errors and to increase the efficiency. The main focus of this project is to lessen human efforts. The maintenance of the records is made efficient, as all the records are stored in the database, through which data can be retrieved easily. The navigation control is provided in all the forms to navigate through the large amount of records. If the numbers of records are very large then user has to just type in the search string and user gets the results immediately. The editing is also made simpler. The user has to just type in the required field and press the update button to update the desired field.

The Books and Students are given a particular unique id no. So that they can be accessed correctly and without errors. Our main aim of the project is to get the correct information about a particular student and books available in the library.
